- (57) Sammendrag:
A rewinder device 100 configured to fasten goods is disclosed. The rewinder device 100 comprises a generally circular plate 102 configured to have one or more passages 104 of predefined size equidistant with a central opening 106 on a surface of the 5 circular plate 102 and a disc-shaped support section 110 is removably attached to the circular plate 102 via one or more arch-shaped passages 112 equidistant with a central elongated pin 114 using a plurality of clamping pins 116 to securely wind a cord 118 on the rewinder device 100. The clamping pins 116 are adjusted using a self-fastening mechanism and the disc-shaped support section 110 is rotated in an anti-clockwise 10 direction to release the clamping pin 116 to unwind the cord 118 on the rewinder device 100.
